OS LAB TASK-||

Operating System

QNO1. Create a new user.

Objective: To create a new user account in Linux.

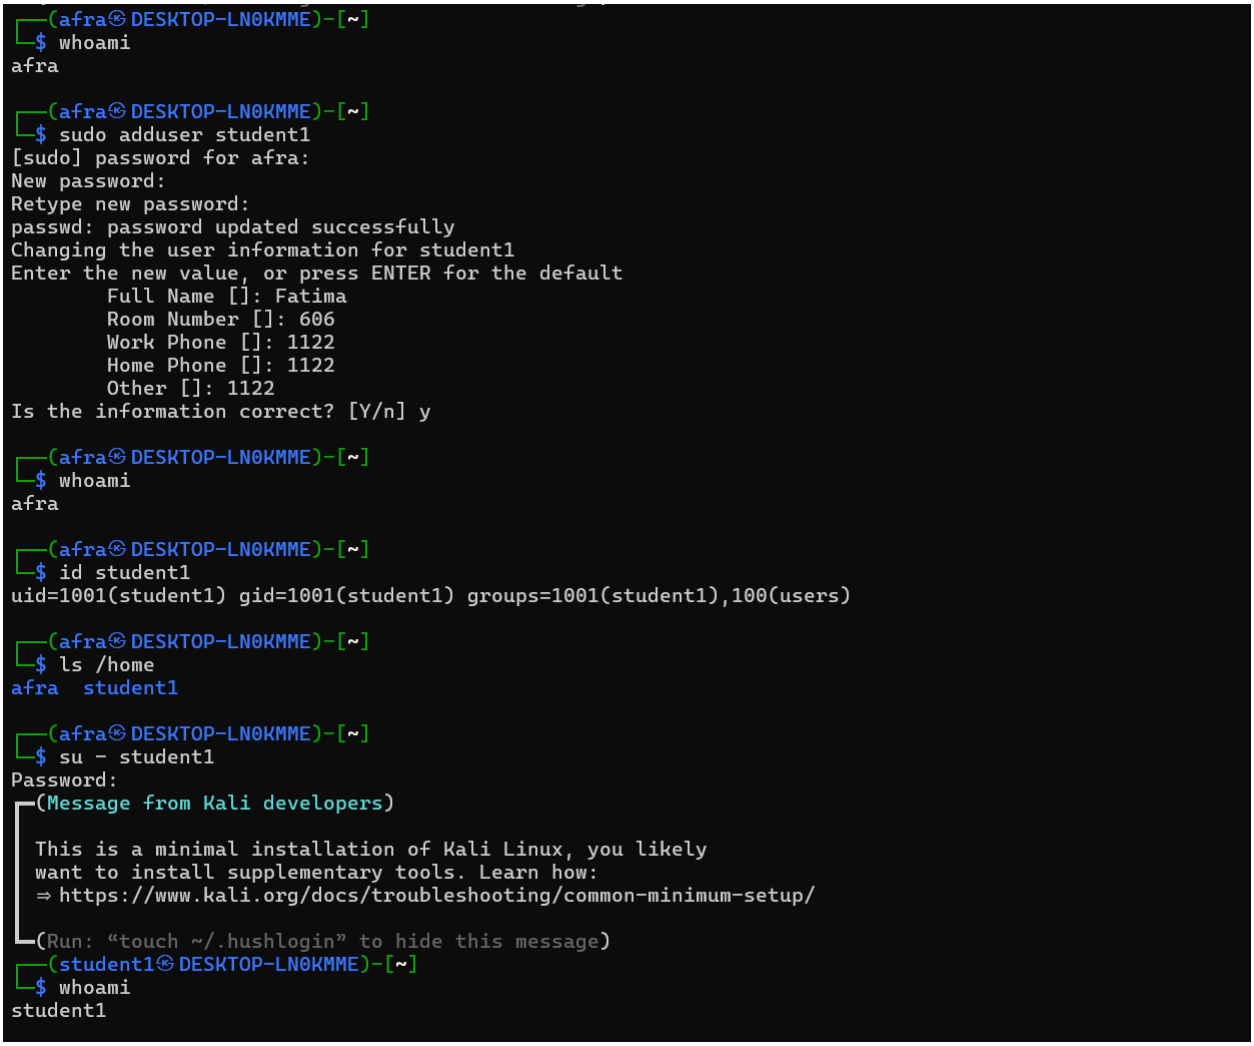

Command Used:

sudo adduser student1

Description:

In this task, I created a new user named student1 in Kali Linux. I used the adduser command to create the account. The system asked me to enter a password and some additional information, such as the user's full name and phone number. After completing these steps, the user account was created successfully.

I also checked the /home directory to confirm that the new user's home directory existed.

QNO2. Modify a user.

Objective: To modify the information of an existing user and verify the changes.

Step 1: Modify the User

Command Used:

sudo usermod -c "Practice wala student" student1

Description:

In this task, I modified the existing user student1 using the usermod command. I used the -c option to update the comment or full-name information of the user. I ran this command from the afra account because it had the required administrative permissions.

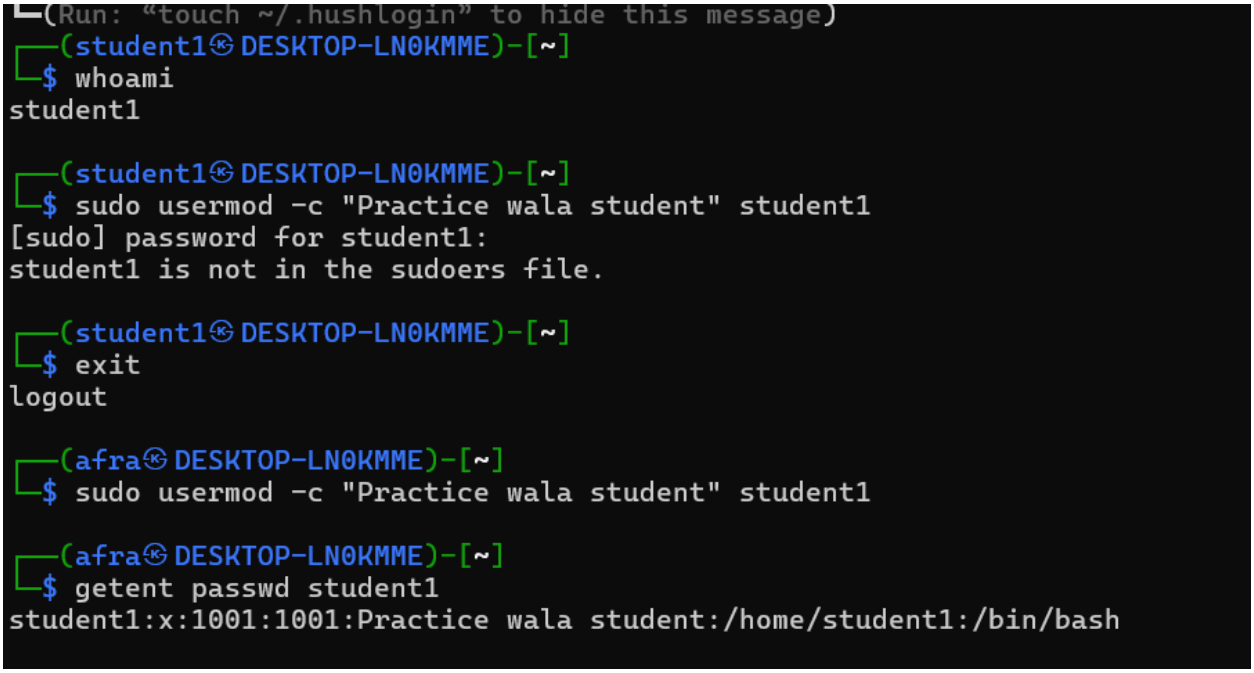

Step 2: Verify the Changes

Command Used:

getent passwd student1

Description:

After modifying the user, I used the getent passwd command to verify the changes. The output displayed the account information of student1, including the updated comment, user ID, group ID, home directory, and default shell.

QNO3. Open linux Task Manager.

Objective: To view running processes and system resource usage in Linux.

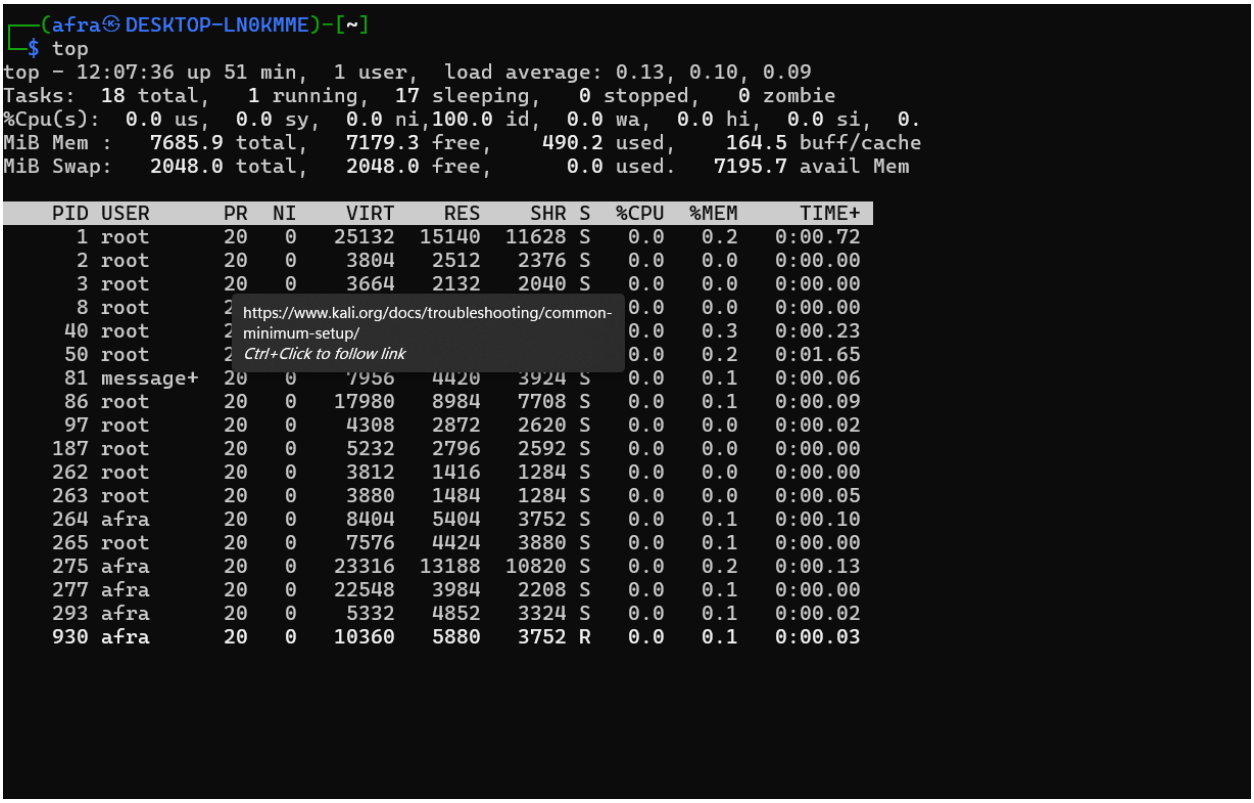

Command Used:

top

Description:

In this task, I used the top command to open the Linux process monitoring tool. It displayed information about running processes, CPU usage, memory usage, process IDs (PIDs), and the users running those processes.

I observed the processes and system resource information displayed on the screen. I pressed the q key to exit the tool and return to the terminal.

QNO4.Kill any Process

Objective: To identify and terminate a process in Linux.

Step 1: Create a Test Process

Command Used:

sleep 300 &

Description:

I used the sleep 300 & command to start a test process in the background. The process waited for 300 seconds. The terminal displayed its Process ID (PID), which was 946.

Step 2: Check the Process

Command Used:

ps -p 946

Description:

I used the ps -p command to check whether the process with PID 946 was running. The output showed the process name as sleep, confirming that the process existed.

Step 3: Terminate the Process

Command Used:

kill 946

Description:

I used the kill command followed by the process ID to send a termination signal to the test process. The terminal displayed a message indicating that the sleep 300 process had been terminated.
